

End-to-end walk — OCP Access Tracking Dashboard 0.19.0 on CRC

Application 0.19.0 (commit 3629c8ca27), chart group-sync-dashboard-0.21.0, on the reference cluster OpenShift 4.18.2. Driven by Playwright (Chromium, 1440x900) through the real route `https://group-sync-dashboard.apps-crc.testing`, logged in as kubeadmin through oauth-proxy and OpenShift OAuth. Run 2026-09-14T11:11:44Z → 2026-09-14T11:17:00Z. Every number below is read from the run's results files or measured on the downloaded artefacts; nothing is typed in from memory.

Outcome: PASS. 75 of 75 scripted steps passed in the main walk; 23 of 24 in the second pass (the one failure is a product finding, §9, not a test defect). All 11 reports in the catalogue generated as PDF and HTML; 33 artefacts downloaded through the page's own download path; 11 of 11 reports passed the four-way integrity check.

1. What was measured

Measure	Value
Route	<code>https://group-sync-dashboard.apps-crc.testing</code>
Identity used	kubeadmin (kubeadmin@cluster.local), authenticated=True, scope all
Application / commit / branch	0.19.0 / 3629c8ca27 / feat/d2-per-cluster-authorization (dirty=False)
Features	export=True, reporting=True, reporting_prefix=/report
Chart / Helm revision	group-sync-dashboard-0.21.0 / revision 221 (2026-09-14 02:33:47)
Pods	group-sync-dashboard-5fb6c5b6d8-lg66b (2/2) group-sync-dashboard-report-cf59f655f-bqv2d (1/1)
Images	group-sync-dashboard: group-sync-dashboard:0.19.0-3629c8ca27; group-sync-dashboard-report: group-sync-dashboard-report:0.19.0-3629c8ca27;
Tabs offered	9 tabs: Overview, Groups, Users, Access granted, RBAC policy, Namespace audit, Logins, Usage, Reports
Reports in the catalogue	11 (11 enabled); PDF variant pdf/a-2b
Report runs, generation time	min 1.6 s · max 7.8 s · all 11/11 done
Artefacts downloaded	33 files, 1,317,089 bytes
Recent-runs table	16 runs listed
Scripted steps	main walk 75 passed / 0 failed; second pass 23 / 24; PDF first pages rendered 11 / 11

2. Login through the real ingress

oauth-proxy's interstitial, OpenShift's identity-provider chooser (two providers on this lab), the credential form, then the dashboard. The ServiceAccount is the OAuth client, so a consent page can appear; this session did not show one.

open the route — <https://group-sync-dashboard.apps-crc.testing> → <https://group-sync-dashboard.apps-crc.testing/>

identity-provider chooser — offered: developer, ldap-local; picked developer

OpenShift login form — username filled: kubeadmin

✓ dashboard rendered at <https://group-sync-dashboard.apps-crc.testing/#page=overview&cluster=crc-local>

3. API probes from inside the session

Same-origin fetches issued by the page, so the proxy cookie travels with them.

Endpoint	HTTP	Body (abridged)
/api/whoami	HTTP 200	<pre>{"user":"kubeadmin","email":"kubeadmin@cluster.local","authenticated":true,"logout_url":"/oauth/sign_out","session":{"cookie_expire_seconds":14400,"cookie_refresh_seconds":0,"idle_timeout":{"enabled":false}},"visibility":{"scope":"all","enabled":true,"clusters":{"crc-local":{"policy":"inherit","identity":"same-as-host","scope":"all"}}}}</pre>
/api/version	HTTP 200	<pre>{"leader":true,"version":"0.19.0","commit":"3629c8ca27","branch":"feat/d2-per-cluster-authorization","dirty":false,"features":{"export":true,"reporting":true,"reporting_prefix":"/report"},"timezone":{"name":"America/New_York","abbrev":"EDT","utc_offset":"-0400"}}</pre>
/api/clusters	HTTP 200	<pre>[{"id":"crc-local","enabled":true,"reachable":true,"status":"ok","last_poll":"2026-09-14T11:11:05Z","group_count":66,"groupsync_count":3,"visibility":{"policy":"inherit","scope":"all"}},{"id":"prod-east","enabled":true,"reachable":true,"status":"ok","last_poll":"2026-09-14T07:33:36Z","group_count":66,"groupsync_count":3,"visibility":{"policy":"inherit","scope":"all"}}]</pre>
/report/healthz	HTTP 200	<pre>{"status":"ok"}</pre>
/report/readyz	HTTP 200	<pre>{"status":"ready","snapshot":"2026-09-14T11:11:06.529345Z","schema":11}</pre>

4. Every tab

Each tab is clicked, the page waits for the tab to report aria-current, the network to settle and a heading to exist, and the capture is refused if any JavaScript error or a visible “Dashboard API error” occurred.

Policy operator (NamespaceConfig / GroupConfig)

These CRs template the RoleBindings above. A currently-failing one means RBAC has quietly stopped reconciling — new namespaces receive nothing and drift stops being corrected, with no error anywhere else.

Group bindings on this cluster

Grant a real group

Need review

Built-in

201

34

6

157

Direct RoleBindings and ClusterRoleBindings whose subject is a Group. Role rules are not evaluated, so this is what has been granted, not a computed list of permitted actions.

6 bindings that grant nobody

Each names a Group that does not exist, so the access it grants reaches no one. Nothing on the cluster reports this — `oc get rolebinding` shows a perfectly healthy object. The 34 bindings that grant a real group follow below; the 157 built-in ones are behind the filter above.

dangling **Dangling** · 0

The group was operator-managed and has disappeared.

None.

unresolved **Unresolved** · 6

These do not raise alerts: a group that has never been seen cannot be told apart from one that simply has not synced yet. They still grant nobody — typically a misspelled group name, or an onboarding that stopped halfway.

GROUP NAMED BY THE BINDING ▲	REACHES	GRANTS	SCOPE	BINDING
app-ocp-rbac-klt-ns-audit	—	view ClusterRole	kit-pass-mnemonic-3char	kit-audit-rb
app-ocp-rbac-klt-ns-developer	—	edit ClusterRole	kit-pass-mnemonic-3char	kit-developer-rb
app-ocp-rbac-klta-ns-audit	—	view ClusterRole	kit-pass-both	klta-audit-rb
app-ocp-rbac-klta-ns-developer	—	edit ClusterRole	kit-pass-both	klta-developer-rb
app-ocp-rbac-toolongx-ns-audit	—	view ClusterRole	kit-fail-mnemonic-toolong	toolongx-audit-rb
app-ocp-rbac-toolongx-ns-developer	—	edit ClusterRole	kit-fail-mnemonic-toolong	toolongx-developer-rb

unmanaged **Unmanaged** · 4

Hand-made grants on operator-synced groups, outside the policy system. Acknowledge a deliberate one with the `rbac.ocp.io/unmanaged-exception` annotation on the binding; the justification then lives next to the object and clears it here.

GROUP NAMED BY THE BINDING ▲	REACHES	GRANTS	SCOPE	BINDING
app-ocp-rbac-demo-cluster-admin >	1 member · 1 logged in	cluster-admin ClusterRole	cluster-wide	demo-cluster-admin-crb
app-ocp-rbac-demo-cluster-audit >	1 member · 0 logged in	view ClusterRole	cluster-wide	demo-cluster-audit-crb

4 grants outside the policy system

Policy CRs

6

Unmanaged

4

Audit-stamped

0

A grant is unmanaged when it names an operator-synced group but carries none of the policy operator's provenance — somebody granted access by hand. Acknowledge a deliberate one with the `rbac.ocp.io/unmanaged-exception` annotation on the binding; the justification then lives next to the object and clears it here.

Policy operator (NamespaceConfig / GroupConfig)

These CRs template the RoleBindings above. A currently-failing one means RBAC has quietly stopped reconciling — new namespaces receive nothing and drift stops being corrected, with no error anywhere else.

KIND	NAME	STATE	LAST SUCCESS
GroupConfig	baseline-cluster-rbac	ok	11m ago
GroupConfig	custom-cluster-rbac	ok	11m ago
NamespaceConfig	baseline-nonprod-rbac	ok	10h ago

High exposure

highest risk on this cluster

Namespaces at risk

4

People exposed

8

Grants to migrate

10

Critical

0

High

2

Why this is a risk

Offboarding does not revoke it

Removing someone from an LDAP group revokes their access everywhere at once. A binding that names the person keeps granting after they leave the team, change role, or leave the company — until somebody remembers it exists.

Invisible to access review

Every group-based review — including the rest of this dashboard — answers "who is in the group?". These grants are attached to no group, so a clean review can coexist with standing access nobody approved.

No approval trail

Group membership is granted in the enterprise directory, with a request and an approver. A hand-made binding records only who ran oc, and only for as long as the audit log is retained.

Exposure by namespace

Ranked by the worst privilege granted, not by count — one forgotten cluster-admin matters more than twenty view grants.

RISK	NAMESPACE	HIGHEST PRIVILEGE	PEOPLE	GRANTS	WHO IS EXPOSED
High	CLUSTER-WIDE	edit	2	2	dana.lee jdoe
High	legacy-payments	admin	3	3	asmith bwilliams jdoe
Medium	legacy-reporting	edit	2	2	jdoe tmp-contractor-9931
Low	openshift-console-user-settings	view	3	3	developer jane.smith john.doe

37 platform identities excluded — system components and kubeadmin are break-glass and cluster-internal, with nowhere to migrate to.

How to close it

Work top-down: the table above is already in the order to do it in.

1. Identify the role.

Match the grant to the LDAP group the operator already syncs for that privilege — the naming convention encodes it (<app>-ns-admin, -ns-developer, -ns-audit).

2. Add the person to that group

in the enterprise directory, through the normal request-and-approve path. Access now has an owner and an audit trail.

3. Wait one sync

and confirm on the Groups tab that they appear as a member. Do not skip this — deleting first leaves them locked out.

4. Delete the direct binding.

oc delete rolebinding <name> -n <namespace>

5. Confirm it is gone

here on the next refresh.

Operational goal: zero rows on this page. At zero, one directory change offboards a person from the entire cluster, and an access review that reads clean is clean.

Every grant

Show 10 grants

The per-namespace table above is the view to work from. This is the flat detail list — collapsed by default on purpose, because on a cluster with thousands of direct grants rendering every row costs time nobody gets value from.

371

45

11h ago

Watching since 2026-08-07 19:47:59 EDT (37d ago); oldest attempt still retained 2026-09-06 10:37:34 EDT; last read 2026-09-14 07:11:06 EDT (58s ago). Nothing before capture began was ever recorded — the oauth-server's log dies with its pod and cannot be read backwards — so an empty list here means nothing was observed, never that nobody signed in. The oldest attempt predates the first read because that read looked back an hour, which is expected rather than a fault.

Cluster access

discovered

3

people hold access they cannot use

Gate group

app-ssb-autobahnusers

Allowed to log in

8

Hold access

10

Cannot log in

3

Gated, no access

1

Membership of cn=app-ssb-autobahnusers,ou=8groups,dc=ephico2real,dc=com is required to authenticate, so anybody outside it cannot use access they hold. Both spellings of the membership attribute are read when the DN is discovered — `memberOf` on OpenLDAP and Active Directory, `isMemberOf` on 389-ds and Oracle DSEE — because neither is standardised.

Access that cannot be used

USER	GROUPS	THROUGH	MEMBER SINCE	TRIED TO LOG IN
bob.wilson >	26	app-ocp-rbac-alpha-cluster-audit app-ocp-rbac-alpha-cluster-developer +24 more	2026-08-02 08:00:33 EDT	▲ yes, and was refused
charlie.brown >	6	app-ocp-rbac-finance-cluster-developer app-ocp-rbac-newteam-cluster-admin +4 more	2026-08-02 08:00:33 EDT	▲ yes, and was refused
hello1 >	1	test-group1	2026-08-03 16:55:37 EDT	not since capture began

Every one of these holds access through a synced group and is not in the gate group, so the access is unusable until either the person is added to the gate group or the grant is removed — which of those is right is the access review's decision, not this page's. Tried to log in reads the login record, so it only sees attempts since capture began; *not since capture began* is not evidence that nobody tried. A name here that is also in the login record with `no` match is the case the oauth log cannot resolve on its own: a real person, outside the gate group, rather than a username that does not exist.

Allowed to log in, holds no access

USER	IN THE GATE GROUP SINCE	TRIED TO LOG IN
ocp-oauth-bind-serviceid · ocp-oauth-bind-serviceid	2026-08-07 22:51:14 EDT	not since capture began

Not automatically a problem — a new joiner looks exactly like this, and so does somebody who only needs what `system:authenticated` already grants. It is worth reading because it is also where a SERVICE identity inside the gate group shows up: on the reference directory the group's own LDAP bind account carries a `uid`, so it syncs like a person and can authenticate with its bind password.

Accounts in no synced group

USER	ATTEMPTS	FIRST SEEN	LAST SEEN	LAST OUTCOME	EVER GOVERNED
lana.lee	1	2026-08-10 08:58:34 EDT	2026-08-10 08:58:34 EDT	▲ no match	never

Membership is checked against what this dashboard has SYNCED, so an account here is in no group the operator manages — it may still hold access granted by a binding made by hand, which the Access granted tab is where to look. Ever governed reads the membership timeline: *was*, and *no longer* is means the removal is recorded and the account is still being used, which is an offboarding that did not finish. Attempts on a local HTTPasswd provider are excluded, so an account that only ever signs in that way — `kubeadmin`, `developer` — never appears here. The exclusion is per ATTEMPT, not per name: if somebody types a break-glass name at the *directory provider* it does appear, on the strength of that attempt, which is worth seeing rather than hiding.

Times render in the server's timezone; the Day column is a UTC date. That split is deliberate rather than an oversight: the day is a stored bucket, computed server-side when the activity was recorded, so re-labelling it local would misstate rows already written, and re-bucketing would make the same column mean one thing before a deploy and another after. Near midnight a session can therefore sit on the following UTC day. An interaction is one deliberate action — opening the dashboard, switching tab, drilling in, changing a filter — not one HTTP request: the page refreshes itself every 60s and counting those measured how long a tab was left open rather than whether anyone used it. Reading time is invisible, so a long look at one page counts once. These are not logins either: the proxy owns this dashboard's session, so nothing here records a sign-in to it. Logins to the cluster are a separate record with a separate source — the oauth-server's own log — and they are on the Logins tab.

tab Usage — heading: Dashboard usage

5. Reports — the catalogue

11 reports in the catalogue, 11 enabled; PDF on, variant pdf/a-2b.

Cluster: crc-localOverviewGroupsUsersAccess grantedRBAC policyNamespace auditLoginsUsageReports

Reports

Generated by the report service from a read-only copy of this dashboard's data (PDF pdf/a-2b and HTML). Every document carries the sha256 of its data, the snapshot it was built from, and who generated it.

Namespace access report

Per namespace: every group binding classified with who it reaches, every direct user grant, findings first.

Access matrix

Every subject (group or direct user), the namespaces it is bound in and the role granted — the "who has access where" sheet, by role name.

Privileged access review

Every subject holding cluster-admin at any scope, or admin/edit cluster-wide, with the people behind each group.

RBAC binding findings

Dangling, unresolved and unmanaged group bindings, direct user grants, and the platform identities excluded — the classification the RBAC policy tab shows.

Groups and membership changes

Every synced group: provider, member count, last sync, bindings, cliff silence, the empty and unattributed lists, joins and leaves in the window.

Users

Every User object (a login), its identity providers, group count and direct grants; manual accounts; synced members who have never logged in.

Login activity

Attempts by outcome and provider, per-user successes and failures, and rejected attempts resolved against the login gate.

Dormant and unusable access

Members with access who have never logged in, members outside the login gate, gate members with no access, and — with login capture — nobody-in-N-days.

GroupSync and policy-operator health

Every GroupSync CR with its computed state, schedule and last sync; reconcile errors (current vs stale); syncs in

Namespace access report

Per namespace: every group binding classified with who it reaches, every direct user grant, findings first.

namespaces *

Comma-separated namespace names, at most 50; ("cluster-scoped") for cluster-wide bindings.

GeneratePDFHTML

include_members

Expand group rosters. Off by default — a file that gets emailed has no reader log — and recorded in the provenance when on.

6. Reports — every report generated, downloaded and opened

For each report: the form (required parameters filled where the report has no default), Generate with PDF and HTML both ticked, the run polled to a terminal state, the three artefacts downloaded through the page's own buttons, the PDF's first page rendered, and the HTML opened in a browser.

7. Integrity of the artefacts

Every report is sealed with the sha256 of its canonical data (name, cluster, params, coverage, totals, truncated, include_members, sections; sorted keys, compact separators). Four independent checks per report: the hash recomputed from the downloaded JSON equals the JSON's own sha256 field; the run record the page polled reports the same hash; the PDF's metadata carries sha256 <hash>; the HTML carries the hash prefix. The PDF/A marker (pdfaid:part) is also checked.

Usage

Reports

Reports

Generated by the report service from a read-only copy of this dashboard's data (PDF pdf/a-2b and HTML). Every document carries the sha256 of its data, the snapshot it was built from, and who generated it.

Namespace access report

Per namespace: every group binding classified with who it reaches, every direct user grant, findings first.

Access matrix

Every subject (group or direct user), the namespaces it is bound in and the role granted — the "who has access where" sheet, by role name.

Privileged access review

Every subject holding cluster-admin at any scope, or admin/edit cluster-wide, with the people behind each group.

RBAC binding findings

Dangling, unresolved and unmanaged group bindings, direct user grants, and the platform identities excluded — the classification the RBAC policy tab shows.

Groups and membership changes

Every synced group: provider, member count, last sync, bindings, cliff silence; the empty and unattributed lists: joins and leaves in the window.

Users

Every User object (a login), its identity providers, group count and direct grants; manual accounts; synced members who have never logged in.

Login activity

Attempts by outcome and provider, per-user successes and failures, and rejected attempts resolved against the login gate.

Dormant and unusable access

Members with access who have never logged in, members outside the login gate, gate members with no access, and — with login capture — nobody-in-N-days.

GroupSync and policy-operator health

Every GroupSync CR with its computed state, schedule and last sync; reconcile errors (current vs stale); syncs in progress.

Access certification pack

Per group (with roster) and per directly-bound user: every binding held, with Approve / Revoke / Comment columns and a sign-off block for the named reviewer.

Recent runs after the walk — 16 runs listed

8. Second cluster, light theme

The cluster selector offers: crc-local, prod-east. Scope pill: “Full view — you are seeing everything”.

Overview in the light theme — prefers-color-scheme: light

Selecting prod-east — heading: Still there?; url https://group-sync-dashboard.apps-crc.testing/#page=overview&cluster=prod-east

9. Findings

Finding 1 — a cluster removed from the configuration lingers in the UI. `prod-east` was configured during the D2 live check and removed again (the live ConfigMap lists one cluster, `crc-local`; Helm's user values have no `clusters` key). Yet `/api/clusters` still returns it as enabled, reachable, status ok, with `last_poll` 2026-09-14T07:33:36Z (the last poll before the upgrade that removed it), the Overview counts “heading: `crc-local`” alerts across 2 clusters, three of them *critical* “schedule has stopped firing” for `prod-east` — an artefact of the frozen snapshot — and selecting `prod-east` renders “heading: Still there?; url <https://group-sync-dashboard.apps-crc.testing/#page=overview&cluster=prod-east>”. Mechanism, from the source: cluster rows are upserted from the configuration at startup and never retired (`store.upsert_cluster`); `list_clusters` iterates every stored row, while the per-cluster routes go through `require_cluster`, which consults the configuration and returns 404. Not a test defect; recorded as an issue.

Finding 2 — the report pod is preempted on this saturated lab node. The node runs at 4792m (99%) of CPU requests. The OLM `collect-profiles` CronJob (every 15 min, priority class `openshift-user-critical`) and a marketplace catalog pod preempt a priority-0 pod when they schedule; the scheduler's tie-breaks pick the youngest pod, and once preempted the report pod stays the youngest. 29 preemptions between 2026-09-14T08:25:33Z and 2026-09-14T11:16:05Z; the dashboard pod was untouched. Every run in this walk completed (1.6–7.8 s each) between two preemptions. Lab capacity, but the chart could offer `priorityClassName` for both Deployments so an operator can decide.
